

My habitat project

Name: Adam P.

Cheetahs

Cheetahs can be found in dry forests, grasslands, open plains and desert regions. Cheetahs don't need much water to survive. They get most of what they need while eating. Cheetahs prefer a place with a dry climate. Cheetahs have flexible spines, they have semi retractable claws, long legs, and a tail that allows them to go 110 km an hour.

cheetahs

Cheetahs scientific name is **Acinonyx Jubatus**. The average length and weight of a cheetah is 21 - 72 kg (adult), The length is 1.1 to 1.5 meters (adult).

cheetahs

Cheetahs are found in dry forests, grasslands, open plains, and desert regions. Where you find a cheetah will probably be in a dry land, because they prefer the area of dry lands. Cheetahs go 92 km an hour.

cheetahs

Cheetahs are big predators they hunt animals and eat them for their food. They search through grasslands and bushes searching for their prey. Cheetahs eat small sized animals to medium size animals. They eat hares, impalas, wildebeest calves, and gazelles.

cheetahs

Cheetahs live in a dry climate with other dry animals like rhinos and Elephants etc; in the dry climate there is a lot of light in the daytime, but there at the night it can get very dark and the cheetahs start to howl.

cheetahs

Cheetahs ground features aren't that big their land starts growing dry grass, and trees start growing, and they have a lot of rivers.

cheetahs

Cheetahs are in the family of cats, they are grown cats that make baby **cheetahs** not kittens. Kittens live with their mother for about 4 - 5 weeks and then they have baby kittens and the ball keeps rolling.

cheetahs

How many cheetahs are in the world I can answer that question there are 7100 cheetahs in the whole world you might think that's a lot but in 2018 the population of the world was 7.594 billion people.

Thank you
